INCEPTION REPORT

Project Title: Development of a GLOF Warning System through Strong Endurance Drone- based Long-Range (LoRa) Communication for the Upper Catchment of the Tista River

1. Executive Summary:

The Himalayan Mountain region is facing a Glacial Lake Outburst due to reducing permafrost, resulting in the formation of new lakes with the circumferences of unstable natural dams, which can be easily breached by rainfall, seismic activity, landslides, or avalanches. Different satellite images such as Sentinel-2(10m), Resourcesat- 2 (LISS-IV) data (5 m) can be used for glacial lake morphological study at preliminary level. Due to lack of high spatial resolution satellite image, unfavourable atmospheric conditions, insufficient high-resolution data to achieve precise digital terrain model and deficiency of authenticated geospatial data for AI/ML training, these GLOF studies might not be entirely sufficient. Combining these images with real-time imagery offers a strong approach for detailed and comprehensive glacial lake morphological studies. Real-time images through drone based remote sensing processes have grown for practical solutions. However, the Himalayan Mountain region encompasses many physical barriers such as rugged terrain, unavoidable wind speed, and the absence of infrastructure that makes the area inaccessible for ground based study. Our objective is threefold. First, development of a fixed-wing, inexpensive, and high-endurance drone equipped with Long-range (LoRa) communication technology (open-source) kind of communication technology and post-processed kinematics from GPS for investigating ice fracturing and glacial lake outbursts. Second, developing a machine learning and AI technique to integrate and analyze data from both sources. Third, implementation of a 4G/5G-based warning system, broadcasting any emergency or important information based on the decision made by our analysis.

2. Introduction:

The project is illustrated below with a brief description and the problem statement.

i. Brief of project:

The Himalayan region is increasingly at risk of Glacial Lake Outburst Floods (GLOFs) due to melting permafrost and the formation of unstable glacial lakes. Current satellite imagery lacks the resolution and real-time capabilities needed for precise monitoring, while challenging terrain limits ground-based studies.

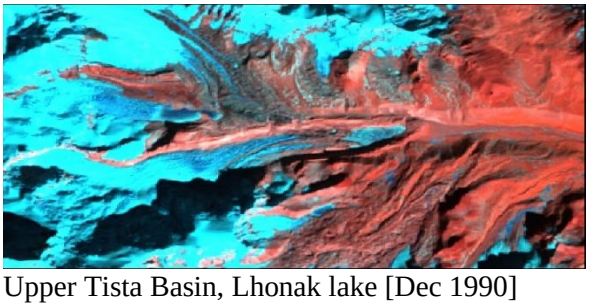

To address these challenges, this project proposes a threefold solution:

a) **Fixed-Wing Drone Development** – An inexpensive, high-endurance drone equipped with Long-Range (LoRa) communication type communication module and GPS post-processed kinematics for real-time monitoring of ice fracturing and glacial lake changes.
b) **AI/ML Integration** – A machine learning framework to analyze and integrate data from satellite images and drone observations for enhanced GLOF prediction.
c) **4G/5G-based Early Warning System** – A real-time alert system that broadcasts emergency warnings based on AI-driven risk assessments.

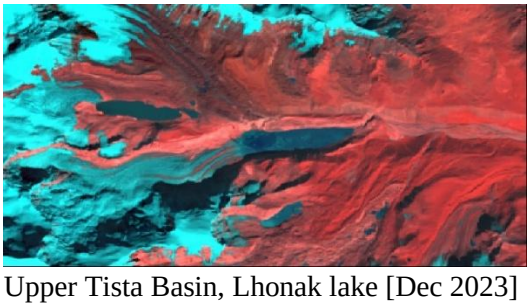

By combining advanced drone technology, AI analytics, and robust communication systems, this project aims to improve GLOF monitoring and disaster response, enhancing safety and resilience in the Himalayan region.

ii. Problem statement:

The Himalayan Mountain region is facing a Glacial Lake Outburst due to the reduction of permafrost region in Greater Himalayan region, resulting in the formation of new lakes and its extension with the circumferences of unstable natural dams, which can be easily breached by rainfall, seismic activity, landslides, or avalanches. This is the preliminary condition of uncertain mountain flood and it is the major concern at the present climatic scenario where global warning and climate change increases the melting rate of glacier in higher altitude region. The glacial Lake scenario in different times is shown in Fig. 1. It poses a real threat of downstream flash flood in a river basin where possible impact will be on destruction of settlement and human lives without any alert. In reality, there will not be any control over the occurrence of such natural incident. Even, it would not be possible to prevent its damages unless the relevant factors which cause such disaster are monitored in regular interval. Early warning system (EWS) is one of the key precursor resilience for the GLOF disaster risk reduction**.** With the advancement of technology, the development of GLOF-EWS overcomes the challenges of natural barriers, atmospheric circumstances, cost efficiency and also reduces the human effort on ground with the inclusion of AI/ML technology. The problems identified and the corresponding objectives set up are presented in Table I.

Upper Tista Basin, Lhonak lake [Dec 1990]

Upper Tista Basin, Lhonak lake [Dec 2023]

Fig. 1 Glacial Lake scenario

Table I: Problems and the corresponding objectives

Glacier Lake Outburst Flood (GLOF)	
Problem	**Objective**
1. Limitations of existing imagery and barrier of Himalayan region - Low spatial resolution (6-10 m per pixel) - Bad weather condition - Rugged terrain, unavoidable wind speed - Ground based system not suitable - Private satellite images are very costly (10-30$/$Km^2$)	**1. Development of a fixed wing, high endurance drone or UAV** **2. Investigating and communicating ice fracturing and glacier lake outburst**
2. Conventional mathematical model (e.g. GIS/DEM) - Static based on elevation and slope - Glacier level change, movement not detected - Limited pattern recognition	**3. Developing an ML/AI technique to integrate and analyze from both satellite and drone images**
3. Data centric non-comprehensive Early Warning System (EWS) - Monitoring same location in same direction - Long time to predict - Lack of relevance in state and district level	**4. Implementation of a 4G/5G based warning system**

3. Project team:
The project team is structured as follows:

i. Details of PI & Co-PI:

- Principal Investigator (PI):

Dr. Manoj Kumar Rana
Research Assistant Professor
Department of Computing Technologies
School of Computing
College of Engineering and technology
SRM Institute of Science and Technology,
Kattankulathur, Tamil Nadu-603203

- Co-Principal Investigator (Co-PI) from SRMIST

Dr. Snehasish Ghosh
Assistant Professor
Department of Computing Technologies
School of Computing
College of Engineering and technology
SRM Institute of Science and Technology,
Kattankulathur, Tamil Nadu-603203

- Co- Principal Investigator (Co-PI) from NIDM

Shri Amarjeet Kumar
Assistant Professor
National Institute of Disaster Management (NIDM)
Ministry of home affairs,
Government of India,
Plot no. 15, pocket-3, block-b, sector-29,
Rohini, delhi -110042

ii. Organization chart of project team/partners:

The organization chart of project is shown in Fig. 2.

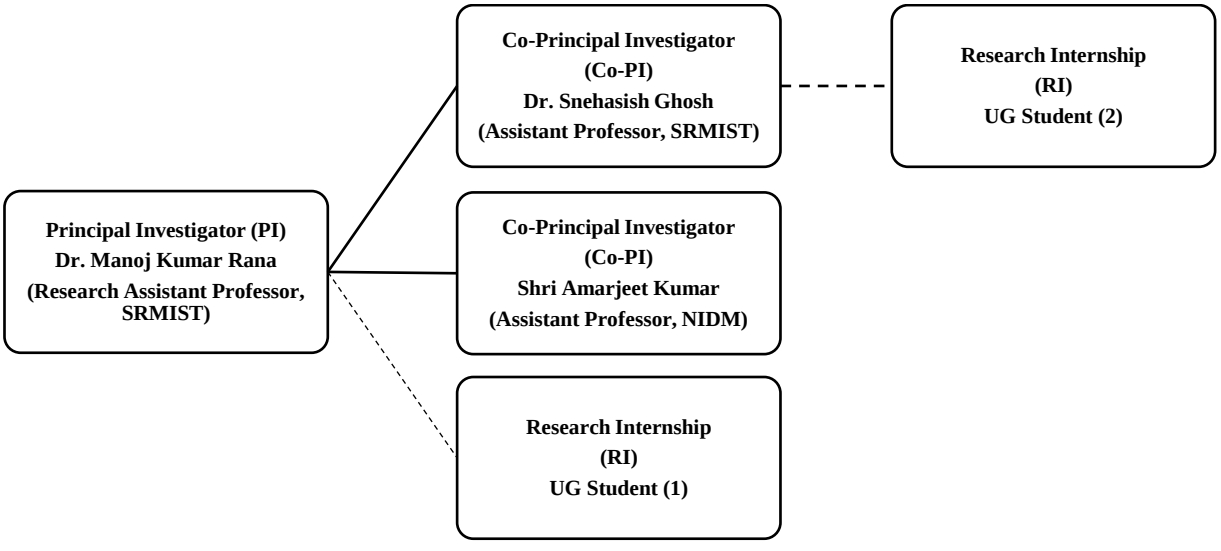

Fig. 2 Organization chart of project team/partners

4. Detailed methodology:

This methodology is outlined through a flowchart shown in Fig. 3, with the details provided step by step below.

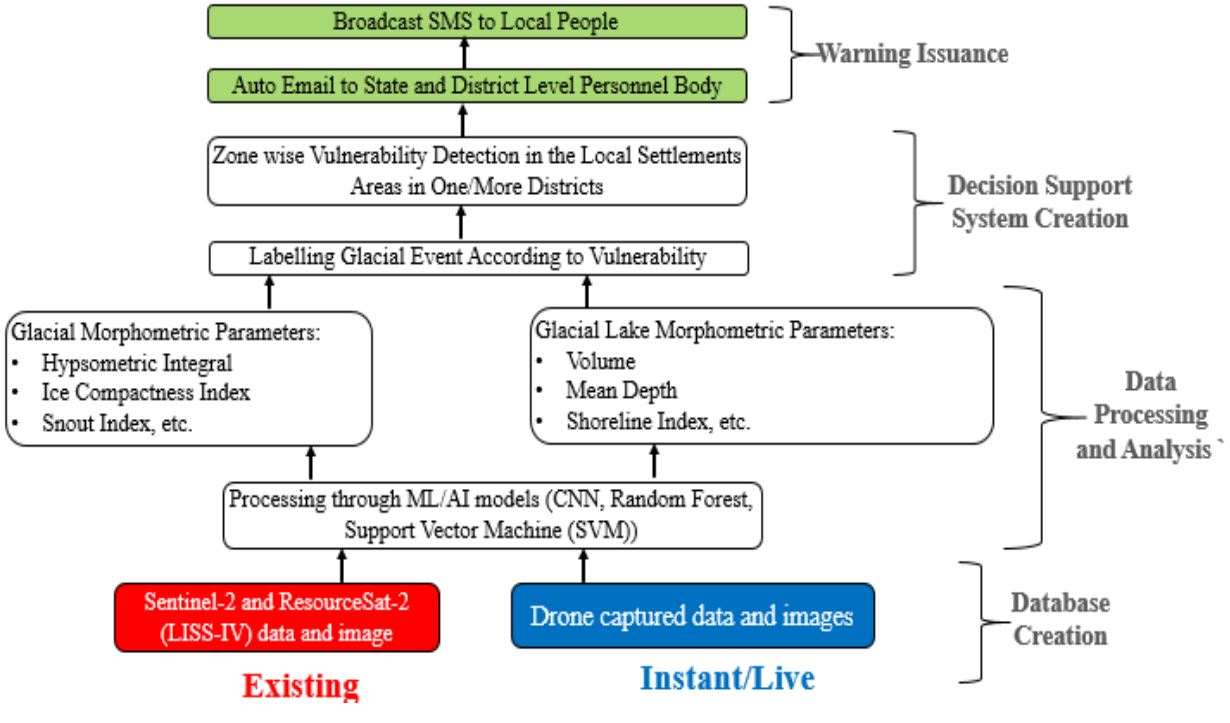

Fig. 3 Outline of the methodology used for the project execution

- **Step 1: Data acquisition**

The data acquisition phase involves collecting images of the target lake(s) from both existing sources and a drone developed by us. However, initially, we will rely on existing sources for post-processing and analysis, as the drone's construction may take some time to complete.

- **Existing sources:** The process starts with data collection from two primary sources: Sentinel-2 (USGS) and ResourceSat-2 (LISS-IV) satellite imagery (NRSC Bhunidhi), which provide pre-recorded data.

- **Drone equipped with camera and communication technology:** Fixed-wing drones excel in Himalayan environments, offering reliable data collection and withstanding Kabat winds of up to 5–10 m/s. They cover up to 50 km without frequent redeployment, while long-range wireless communication enables real-time data transmission in remote areas. GPS post-processed kinematics provide precise geo-referenced ortho-images for accurate GLOF detection. Open-source drone development enhances accessibility, allowing resource-constrained organizations to deploy and customize drones for risk monitoring. By integrating satellite data with high-resolution imagery, drones overcome environmental and temporal constraints for comprehensive GLOF detection and monitoring.
The trajectory of the drone from the base camp to the target lake(s) and back is illustrated in Fig. 4. While our methodology prioritizes in-flight image transmission, images will initially be stored on the camera's SSD card and processed after the drone lands. The in-flight transmission mode will be enabled after field testing, depending on the availability of 4G/5G infrastructure in the area. The overall configuration of the drone and communication modules is shown in Fig. 5.

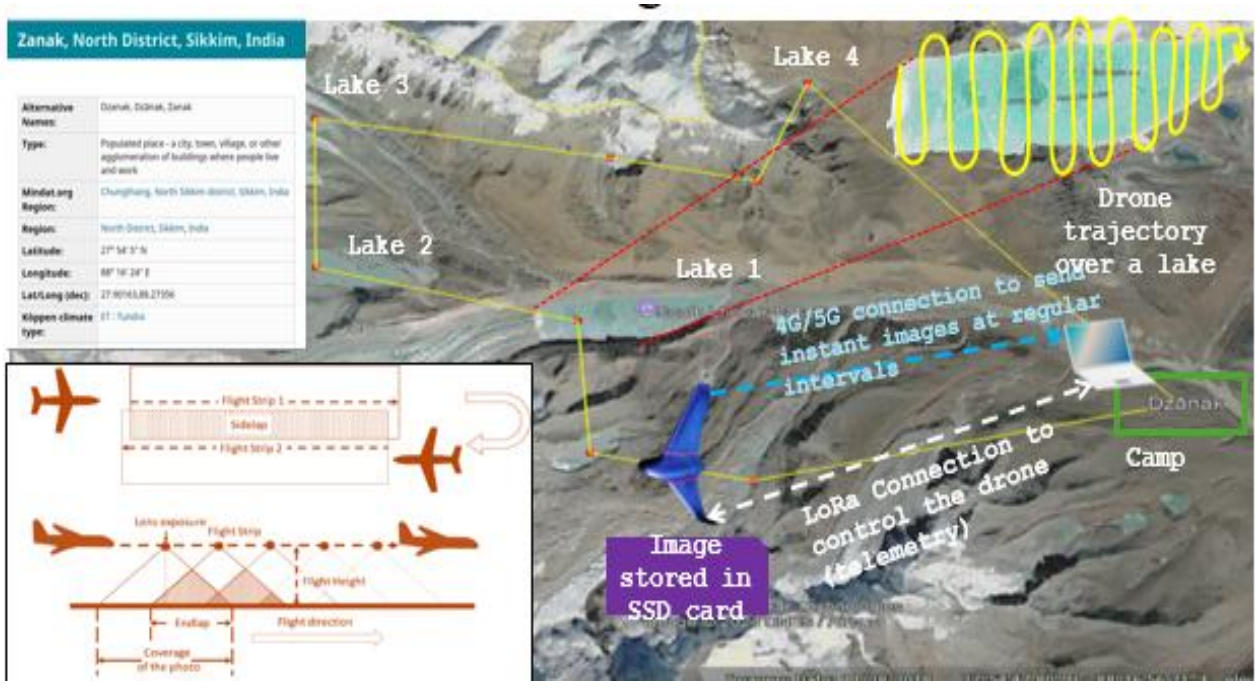

Fig. 4 Drone trajectory from the base camp to the lake(s) and back

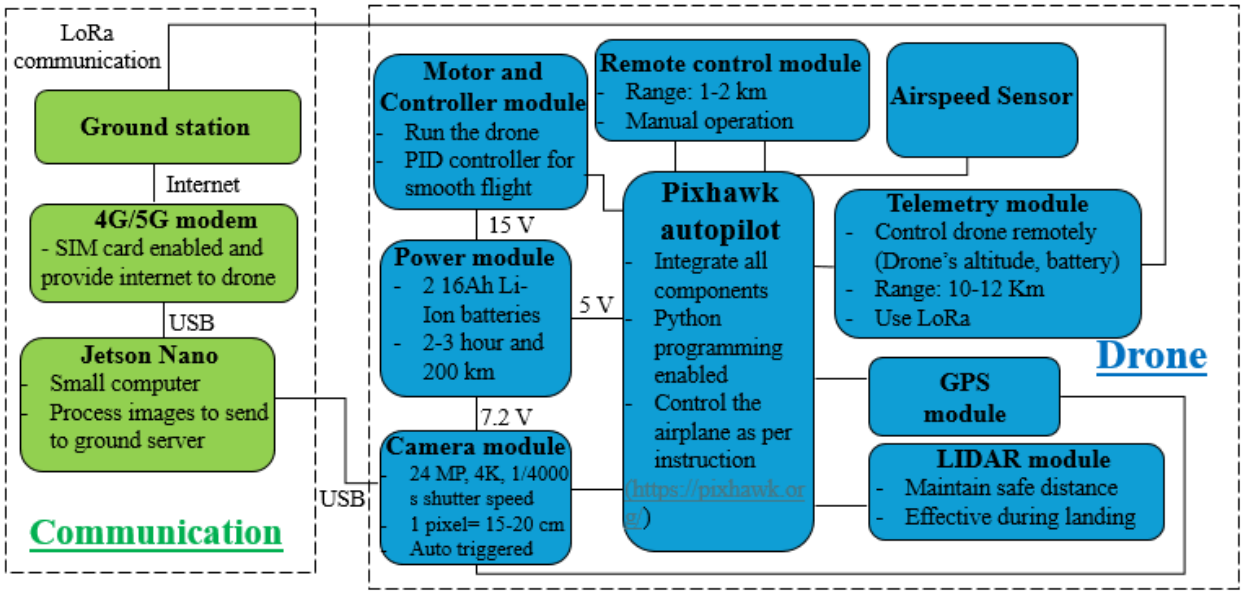

Fig. 5 Configuration of drone and communication modules

- **Step-2: Data Processing and Quantitative analysis**

An ML/AI-based integrated approach is used to analyze data from satellite and drone sources. Advanced models, including Convolutional Neural Networks (CNN), Random Forest, and Support Vector Machines (SVM), detect glacial lakes and monitor their dynamic changes. This solution provides a real-time view of glacial conditions by evaluating historical and real-time data to identify early warning signs of GLOF events.

ML techniques like Random Forest and SVM predict GLOF events, while CNN analyzes drone images to detect anomalies for faster response. Recurrent Neural Networks (RNNs) and Long Short-Term Memory (LSTM) networks analyze time-series data to estimate GLOF likelihood. AI/ML automates large-scale monitoring, with unsupervised learning and clustering aiding in identifying new lakes.

This process computes key glacial morphometric parameters such as the Hypsometric Integral, Ice Compactness Index, and Snout Index, along with glacial lake parameters like volume, mean depth, and shoreline index.

- **Step-3: Decision support system**

The system labels glacial events based on their vulnerability and conducts zone-wise vulnerability detection in affected districts. This information is then used to create a decision support system that aids in risk assessment and response planning.

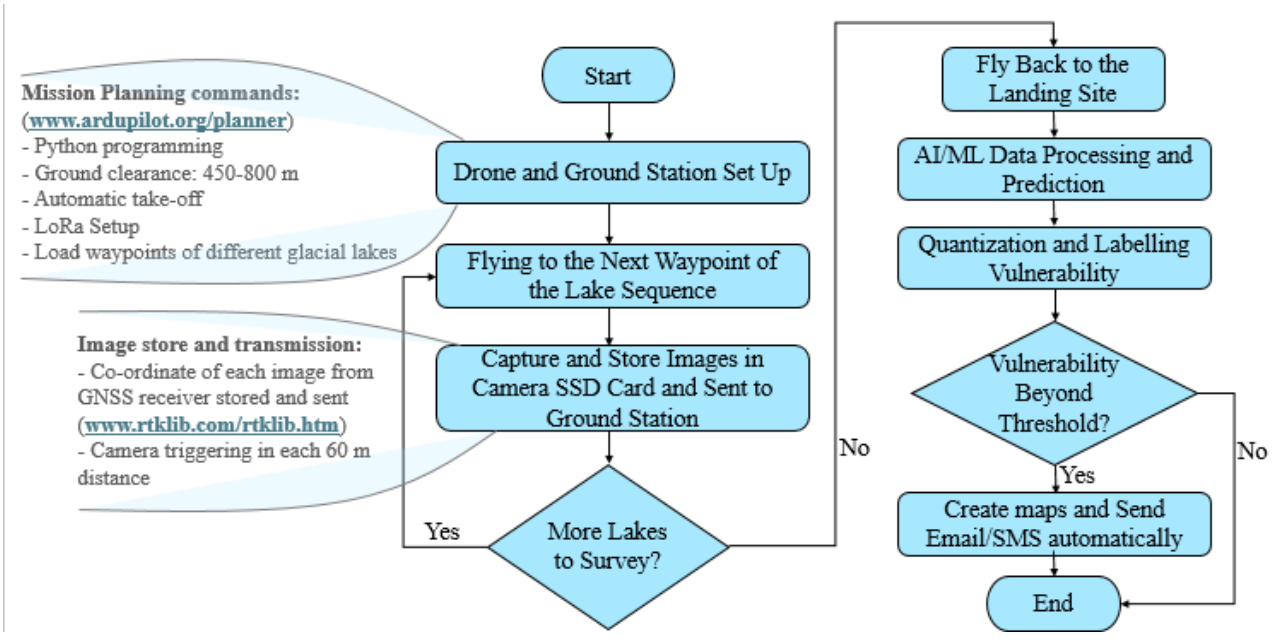

Fig. 6 Procedure for Early warning system

- **Step-4: Development of Early Warning System (EWS)**

The overall procedure of Early warning system (EWS) is shown in Fig. 6. If a potential GLOF is detected, the system triggers an automatic warning issuance process. SMS alerts are sent to local communities, and emails are dispatched to state and district-level authorities, ensuring a timely and effective response. By integrating satellite and drone-based remote sensing with AI-driven analysis, this system enhances GLOF monitoring, risk assessment, and disaster preparedness in the Himalayan region.

5. Role & responsibility of project team (PI& Co-PI):

S. No.	Name of the Investigators	Role	Responsibilities in the proposed project
1.	Dr. Manoj Kumar Rana, SRMIST	PI	• To develop an inexpensive, high-endurance fixed-wing drone equipped with Long-range (LoRa) wireless communication and post-processed kinematics (PPK) GPS for monitoring ice fracturing and glacial lake outburst floods (GLOFs). • To implement a 4G/5G-based early warning system that provides real-time alerts on potential GLOF events based on AI-driven analysis. • Mentor One internship student. • Monitoring the progress of the entire work, timely conduct of meeting, administrative tasks, and financial responsibilities.
2.	Dr. Snehasish Ghosh, SRMIST	Co-PI	To integrate satellite imagery (Sentinel-2, Resourcesat-2) with real-time drone-based remote sensing using AI/ML techniques for enhanced glacial lake morphological analysis.

			1. Data Acquisition and processing • **Satellite Imagery Collection**: Obtain high-resolution multispectral images from Sentinel-2 and Resourcesat-2. • **Drone-Based Remote Sensing**: Deploy UAVs equipped with high-resolution cameras, LiDAR, and thermal sensors to capture real-time data. • **Georeferencing & Calibration**: Align satellite and drone images using GPS and ground control points (GCPs) for accuracy. **2. AI/ML-Based Analysis** • **Feature Extraction**: Identify key morphological features (lake boundaries, water levels, ice cover, debris flow). • **Deep Learning for Classification**: Use CNNs or other deep learning models to classify water bodies, ice, and sediment. • **Change Detection**: Apply temporal analysis using AI to detect changes in lake morphology over time. 3. **Quantification of Morphometric parameters** • **Quantification:** Quantification of Glacial Morphometric and Glacial Lake Morphometric Parameters • **Geospatial database generation:** Geospatial data base generation of morphometric parameters 4. **Mentor One internship student**
3.	Shri Amarjeet Kumar, NIDM	Co-PI	• Coordinate with NIDM and other government agencies for seamless collaboration. • Obtain necessary permissions for fieldwork and secure government support. • Oversee resource allocation and ensure timely execution of tasks. • Supervise project execution, ensuring adherence to timelines and budgets. • Facilitate communication between stakeholders, including government bodies, telecom providers, and research institutions. • Oversee risk assessment and implement mitigation strategies.

6. Objectives and principal research question:

a) Objectives

i. To develop an inexpensive, high-endurance fixed-wing drone equipped with Long-range (LoRa) communication and post-processed kinematics (PPK) GPS for monitoring ice fracturing and glacial lake outburst floods (GLOFs).

ii. To integrate satellite imagery (Sentinel-2, Resourcesat-2) with real-time drone-based remote sensing using AI/ML techniques for enhanced glacial lake morphological analysis.

iii. To implement a 4G/5G-based early warning system that provides real-time alerts on potential GLOF events based on AI-driven analysis.

Principal research question

"How can a fixed-wing, low-cost, high-endurance drone equipped with LoRa communication, GPS post-processed kinematics, and AI-driven data analysis enhance the monitoring, prediction, and early warning of ice fracturing and glacial lake outburst events?"

7. Scope of project:

The project encompasses the development and implementation of an integrated monitoring and early warning system for Glacial Lake Outburst Floods (GLOFs) in the Himalayan region. It involves the use of satellite and drone-based remote sensing technologies to enhance data collection and risk assessment. The scope includes designing a fixed-wing, high-endurance drone equipped with long-range communication and post-processed GPS kinematics for real-time glacial lake monitoring.

Additionally, the project covers the integration of machine learning and AI techniques to analyze satellite and drone imagery, enabling precise detection of glacial lake changes and potential GLOF risks. The deployment of a 4G/5G-based early warning system is also within the scope, ensuring the timely dissemination of alerts. The approach is designed to be scalable, cost-effective, and adaptable, supporting long-term glacial hazard mitigation efforts in remote and vulnerable regions.

8. Stakeholders:

A multi-level stakeholder approach is essential for the successful implementation of this Glacial Lake Outburst Flood (GLOF) monitoring and early warning system**.** The key stakeholders include:

1. National-Level Stakeholders

- **National Institute of Disaster Management (NIDM)** – Responsible for research, training, and policy development for disaster risk reduction.
- **National Disaster Management Authority (NDMA)** – Oversees disaster preparedness and response at the national level and ensures the implementation of early warning systems.
- **Ministry of Environment, Forest, and Climate Change (MoEF)** – Supports research and policy initiatives for climate change adaptation and environmental conservation.
- **Indian Space Research Organisation (ISRO)** – Provides satellite-based remote sensing data for glacial lake monitoring.

2. State-Level Stakeholders

- **State Disaster Management Authorities (SDMAs)** – Implement disaster mitigation and early warning strategies at the state level.
- **State Remote Sensing Agencies** – Assist in geospatial data analysis for GLOF monitoring.
- **State Departments of Water Resources, Environment, and Climate Change** – Support research, policy, and implementation of climate adaptation strategies.

3. District-Level Stakeholders

- **District Disaster Management Authorities (DDMAs)** – Coordinate local disaster preparedness and response efforts.
- **District Administration (District Collectors & Local Authorities)** – Oversee emergency response and communication with communities.

- **Local Law Enforcement & Emergency Services** – Assist in evacuation and disaster response operations.

4. Scientific & Research Institutions

- Universities, climate research centers, and remote sensing labs working on glacial monitoring, AI/ML modeling, and disaster risk reduction**.**

5. Local Communities & NGOs

- **Community-Based Organizations (CBOs) & NGOs** – Conduct awareness campaigns, assist in emergency response, and support community resilience.
- **At-Risk Populations in Himalayan Regions** – Direct beneficiaries of the early warning system, requiring training and preparedness strategies.

6. Technology & Infrastructure Partners

- **AI & Drone Technology Developers** – Work on drone-based remote sensing and predictive analytics.
- **Telecommunication Providers (4G/5G Networks)** – Ensure connectivity for real-time data transmission and emergency alerts.

By integrating national, state, and district-level authorities with scientific institutions, local communities, and technology providers, this project aims to create a comprehensive and effective GLOF monitoring and early warning system for the Himalayan region.

9. Timeline and delivery schedule:

ACTIVITIES	I YEAR				II YEAR			
	3	6	9	12	3	6	9	12
1. Student selection (UG level), Equipment purchase, Satellite data acquisition								
2. Field visit and data collection: Drone image collection, Database creation, Ground based evidence								
3. Image processing through software: Object detection and image classification								
4. Glacial and glacial lake Morphometric analysis and quantification								
4. ML based model and decision Support System								
5. Early Warning System for GLOF: Monitoring of Dynamic changes of glacial lake, Checking warning at various level, Message broadcasting using 4G/5G network								
6. Report Submission								
7. Research publications and patent work								

10. Plan of Action:

- **Objective 1: Development of a Fixed-Wing, High-Endurance Drone**

  i. **Design and Prototyping**
    - Develop a fixed-wing drone optimized for high endurance and long-range operations.
    - Utilize lightweight composite materials for enhanced flight time and durability.
    - Integrate solar-assisted power solutions to extend operational duration.

  ii. **Technology Integration**
    - Equip the drone with Long-range (LoRa) communication technology for efficient data transmission.
    - Implement Post-Processed Kinematics (PPK) GPS for high-precision geolocation.
    - Include multispectral and LiDAR sensors for improved glacial monitoring.

  iii. **Testing and Optimization**
    - Conduct flight tests in controlled environments to evaluate endurance, stability, and data acquisition.
    - Optimize drone navigation algorithms to counteract rugged terrain and high wind speeds.
    - Ensure real-time data transmission capabilities for timely decision-making.

- **Objective 2: Development of AI/ML-Based Analytical Techniques**

  i. **Data Collection and Processing**
    - Gather satellite images from Sentinel-2 and Resourcesat-2 (LISS-IV) for preliminary analysis.
    - Acquire real-time imagery from drone-based remote sensing for high-resolution data.
    - Process and clean geospatial datasets to ensure quality inputs for AI/ML models.

  ii. **Machine Learning and AI Model Development**
    - Train AI/ML models to detect ice fracturing, glacial lake formation, and potential outbursts.
    - Use deep learning techniques for precise segmentation of glacial lakes and unstable natural dams.
    - Develop predictive models integrating various geospatial and climatic parameters.

  iii. **Validation and Refinement**
    - Compare AI/ML model results with historical GLOF events to refine accuracy.
    - Utilize expert feedback and field validation for continual improvement.
    - Integrate ensemble modeling approaches to enhance reliability.

- **Objective 3: Implementation of a 4G/5G-Based Early Warning System**

  i. **Communication Infrastructure**
    - Establish a real-time data transmission network utilizing 4G/5G technology.
    - Implement redundancy measures such as satellite communication in remote areas.

  ii. **Emergency Alert System**
    - Develop a cloud-based platform for automated detection of glacial threats.
    - Create a multi-channel alert system (SMS, mobile app notifications, sirens, community radio broadcasts).
    - Ensure integration with regional disaster management agencies for coordinated response.

  iii. **Community Engagement and Training**
    - Conduct awareness programs for local communities regarding GLOF risks and response protocols.
    - Train field personnel in the use of monitoring tools and emergency communication.
    - Develop a user-friendly mobile application for real-time access to alerts and risk assessments.
